Milk Separators

Model

MN 3004 and MTA 50-03-024

MN 3004D and MTA 50-03-124

MN 3004 and MTA 50-03-024
with normal motor and centrifugal clutch

MN 3004D and MTA 50-03-124
with special type motor, without centrifugal clutch

WESTFALIA SEPARATOR AG./4740 OELDE 1 (W.-GERMANY)

CABLES: WESTFALIA OELDE · PHONE: (02522) 771 · TELEX: 89474

IMPORTANT HINTS TO OPERATORS

=====

- 1) Never start the separator before brakes and bowl locking screws are off.
- 2) When machine is new, make first oil change after 3 to 4 weeks. When broken in, change oil every 2 to 3 months.
- 3) When making oil change, clean gear chamber. Use oil as stated on page 11 only.
- 4) Make sure oil level is always at middle of oil sight glass.
- 5) Check regularly for water in oil. To do this, loosen oil drain screw and allow a small amount of oil to drain out.
- 6) After removing bowl bottom, place protection hood 24 (fig.10) over spindle to prevent wash liquid from seeping into gear chamber.
Do not flush inside of upper frame part with water hose; wash by hand.
- 7) Prior to installing bowl bottom, put two or three drops of oil on guide surfaces of spindle cap and of spindle guiding ring, so that spindle cap can be easily moved on worm spindle.
- 8) Prior to assembling the bowl, threads of bowl bottom and of bowl locking ring as well as centering and bearing surfaces should be carefully cleaned and greased. If bowl is made of solid stainless steel, Molykote paste should be vigorously rubbed and brushed into metal surfaces to prevent jamming.
- 9) Do not loosen any part of separator or of feed and discharge connections before bowl has come to a complete stop.
- 10) Do not place bowl parts on stone floor. Put them on a rubber or wooden surface. Never place bowl top into bowl locking ring. Put distributor on base 10, and stack discs on drying rack 1 (fig.10).
- 11) Never use blow-torch on bowl or expose bowl to heat of direct fire.
- 12) After about 3 weeks of operation, add the numbered spare disc.

WORKING INSTRUCTIONS

=====

1. INSTALLATION

Foundation frame 1a (fig.6) should be imbedded in the floor in such a way that the three raised blocks are flush with the floor (see installation plan, page 36). Fill up the space below the frame with cement. Then make sure that the raised blocks are absolutely level and grout the frame in with cement inside and outside. To accelerate setting of cement, add some commercial rapid binding agent.

To fasten the separator on the foundation frame, proceed as follows (see fig.6):

Screw bolts 1b into the three raised blocks on the foundation frame and put feet 2a with flanges 3 on these bolts. Rubber cushion 2b on each foot is held by washer 2c, lock washer 2d, and screw 2f. Lift separator frame onto feet assemblies. Insert screws 4 through flanges and tighten into frame. Finally tighten screw 2g.

2. MOTOR CONNECTION

2.1 Three phase AC motor for MN 3004D: 4.5 kW
for MN 5004D: 5.5 kW

Milk separators MN 3004D and MN 5004D are powered by a totally enclosed torque controlled built-in motor for clutchless drive. This motor must be started by means of a star-delta switch. The starting time in star connection is 10 minutes. Do NOT switch from star to delta connection before this time has elapsed.

When using a hand-operated star-delta switch, refer to the following table:

Separator Model	50 Cycle		Manual Star-Delta-Switch Amps.	Minimum Section of Lead-in Wires mm ²	Rated Current of Fuses Amps.
	Voltage V	Rated Current Amps.			
MN 3004D	220	18.2	60	6	50
	380	10.5	60	4	35
MN 5004D	220	26.0	60	6	50
	380	15.0	60	4	35

We recommend, however, the use of an AUTOMATIC star-delta switch, specially designed for WESTFALIA separators. This switch is equipped with one release each for the start and for the run, ensuring a full motor protection. Switching from star to delta connection after about 10 minutes, and from start release to working release which takes place 1 1/2 to 2 minutes later, is effected by built-in timers. The automatic star-delta switch is operated by a push-button station which mostly exists on the dairy switchboards. In addition, it is recommended that two indicating lights, one for the start, and one for the run be installed, When ordering an automatic star-delta switch state working voltage of three-phase network and control voltage.

2.2 Three phase AC motor for MN 3004: 4.5 kW
 for MN 5004: 5.5 kW

Separators MN 3004 and MN 5004 are powered by a totally enclosed built-in three phase AC motor with centrifugal clutch. This motor can be started either across the line by means of a three-pole switch, or through a star-delta switch (as per the following table). When using a star-delta starter, switch over from star to delta connection after 4 to 6 seconds.

Separator Model	50 Cycle		Manual Three-Pole Switch or Star-Delta Switch	Minimum Section of Lead-in Wires	Rated Current of Fuses
	Voltage	Rated Current			
	V	Amps.	Amps.	mm ²	Amps.
MN 3004	220	17,3	60	6	50
	380	10,0	60	4	35
MN 5004	220	21,8	60	6	50
	380	12,6	60	4	35

If for across-the-line starting a three phase contactor with overload release is used, the release must be adjusted to 1.5 to 1.8 times the value of the rated current because of the increased starting current. To obtain, however, a PERFECT motor protection, switch over to a second contactor equipped with a release that is adjusted to the rated current of the motor, as soon as the separator bowl has reached its operating speed.

2.3 Direction of rotation and speed of separator bowl

The bowl must turn clockwise, when looked at from above.

Bowl speed: for MN 3004D and MN 3004: 6500 RPM
 for MN 5004D and MN 5004: 6000 RPM.

3. REMOVING THE HORIZONTAL GEAR PARTS MN 3004D, MN 5004D
 =====

3.1 Removing the motor shaft (fig.3)

- 1) Unscrew hexagon head screws 10 and remove fan cover 16.
- 2) Unscrew hexagon head screws 19 (holding bearing shield).
- 3) Unscrew hexagon head screws 35 and remove protecting cover 33.
- 4) Remove wheel protecting cover.
- 5) Loosen screws 30a as well as clamp plates 30b and 30c of worm wheel.
- 6) Unscrew nut 8k while locking motor shaft 8a by putting a screw driver into the bore of brake drum 8g.
- 7) Pull brake drum off the motor shaft.
- 8) Loosen motor shaft by rapping gently with a rubber hammer against the free shaft end and pull out motor shaft with parts 8b-f, h, 11-15 and 17-18, while holding worm wheel to prevent damage to gear teeth. Ball bearing 38 remains in bearing housing 42.

3.2 Removing the worm wheel (fig.3)

- 1) Remove the motor shaft (see sect.3.1).
- 2) Take worm wheel assembly with clamp plates, 30a-s), out of gear chamber.

3.3 Removing the stator (fig.3)

- 1-6) See sect.3.1 items 1 and 3 to 7.
Do NOT loosen screws 19 (holding bearing shield).
- 7) Loosen motor shaft 8a by rapping gently with a rubber hammer against the free shaft end and pull it out together with stator assembly 20 (including motor housing and terminal box), and parts 8b-f, h, 11-15, 17, and 18. While pulling out, hold worm wheel to prevent damage to gear teeth.
- 8) Unscrew nut 8d and remove fan 8b.
- 9) Unscrew hexagon head screws 19 and pull off bearing shield 17 with parts 8f, 11-15, and 18.
- 10) Pull stator assembly 20 (including motor housing and terminal box) off the motor shaft.

3.4 Removing ball bearing 13 (motor side, fig.3)

- 1) Remove the motor shaft (see sect. 3.1).
- 2) Unscrew nut 8d and remove fan 8b.
- 3) Pull distance sleeve 8f off the motor shaft.
- 4) Pull off bearing shield 17 together with parts 11-15, and 18.
- 5) Unscrew hexagon head screws 11 and remove bearing cover 14 with felt ring 12 and gasket 15.
- 6) Push ball bearing 13 out of bearing shield.

3.5 Removing ball bearing 38 (brake side, fig.3)

- 1) Remove the motor shaft (see sect. 3.1).
- 2) Unscrew hexagon head screws 32 and remove bearing cover 31 with parts 38-43.
- 3) Push ball bearing 38 out of bearing housing 42.

4. REMOVING THE HORIZONTAL GEAR PARTS MN 3004, MN 5004

=====

4.1 Removing the clutch shoes (fig.4)

- 1) Unscrew hexagon head screws 34 and remove protecting cover 32.
- 2) Unscrew nut 39 whilelocking motor shaft 8a by putting a screw driver into the bore of clutch drum 31f.
- 3) Pull clutch driver 31k with clutch shoes 31g and snap ring 31h off the motor shaft.
- 4) Pull clutch shoes off the pins of clutch driver.

4.2 Removing the centrifugal clutch (fig.4)

- 1) Remove clutch shoes (see sect. 4.1).
- 2) Remove wheel protecting cover.
- 3) Loosen screws 30a as well as clamp plates 30b and 30c of worm wheel.
- 4) Remove screws 38 through bores of clutch drum 31f.
- 5) Use special puller to remove clutch drum assembly 31a-f together with parts 40 to 44.

4.3 Removing the motor shaft (fig.4)

- 1) Remove clutch shoes (see sect. 4.1).
- 2) Unscrew hexagon head screws 10 and remove fan cover 16.
- 3) Unscrew hexagon head screws 19 (holding bearing shield).
- 4) Loosen motor shaft assembly 8a-g by rapping gently with a rubber hammer against the free shaft end, and pull it out with parts 11 to 15, 17, and 18.

4.4 Removing the worm wheel (fig.4)

- 1) Remove centrifugal clutch (see sect. 4.2).
- 2) Remove motor shaft (see sect. 4.3, item 2-4). While pulling out motor shaft assembly, hold worm wheel to prevent damage to gear teeth.
- 3) Take worm wheel assembly with clamp plates, 30a-h, out of gear chamber.

4.5 Removing the stator (fig.4)

- 1) Remove clutch shoes (see sect. 4.1).
 - 2) Unscrew hexagon head screws 10 and remove fan cover 16.
 - 3) Loosen motor shaft assembly 8a-g by rapping gently with a rubber hammer against the free shaft end, and pull it out together with stator assembly 20 (including motor housing and terminal box), and parts 11-15, 17, and 18.
- 4-6) Refer to sect. 3.3, item 8-10.

4.6 Removing ball bearing 13 (motor side, fig.4)

- 1) Remove motor shaft (see sect. 4.3).
- 2-6) Refer to sect. 3.4, item 2-6.

4.7 Removing ball bearing 42 (brake side, fig.4)

- 1) Remove centrifugal clutch (see sect. 4.2).
- 2) Use screw driver to force snap ring 41 out of groove of clutch drum 31f.
- 3) Pull ball bearing 42 off the neck of clutch drum.

5. REMOVING THE VERTICAL GEAR PARTS (fig.3 or 4)

=====

- 1) Unscrew hexagon head screws 29k.
- 2) Remove snap ring 25m.
- 3) Pull off spindle guiding ring 25k.
- 4) Pull of spindle cap 25f.
- 5) Pull out worm spindle 25a together with parts 25b-d, g, and h, and with the parts of "neck bearing bridge assembly with covering" 29a-h, m-p.

6. ADJUSTING THE BOWL HEIGHT (fig.3 or 4)

=====

Loosen clamp ring 2a (fig.8) by opening handle 2h. Screw off bottom bearing cap 27. Then adjust height of bowl by turning bottom bearing threaded piece 26b so that when lifting the skimmilk discharge assembly (fig.9), the distance between holding ring of hood and skimmilk discharge is 4 mm ($5/32$ "). By a full turn of the bottom bearing threaded piece, the bowl can be raised or lowered by 2mm ($5/64$ ").

After adjusting to proper height or if it is not possible to adjust bowl to sufficient height, check distance between distance ring 29p and neck bearing protection cap 29m. This should be about 2 mm ($5/64$ "). The distance is correct if after removing the bowl, worm spindle 25a can be lifted by about 2 mm. If this is not possible, unscrew hexagon head screws 29k, remove spindle cap 29f, neck bearing protection shield 29n, neck bearing protection cap 29m, and spindle spring 25h, and check whether the two cams of distance ring 29p are located 2 mm below the upper edge of neck bearing pressure ring 29c. If necessary, file the cams to obtain proper distance.

The bowl height is adjusted at the factory prior to shipment of the separator. It must be checked for re-adjustment after each assembly of vertical gear parts, of a new bowl or a new centripetal pump.

7. LUBRICATING THE GEAR

=====

All bearing points of the separator, except the ball bearing 13 on the motor side, are splash lubricated from a central oil bath.

Prior to the first start of the separator, fill gear chamber with oil through oil filling bore at wheel protection cover until oil level is at the middle of sight glass. The separator requires about 2.5 litres of a well refined lubricating oil with a viscosity of 6 to 8E at 50°C. For order-number see page 35.

When machine is new, make first oil change after 3 to 4 weeks. When broken in, change oil every 2 to 3 months. When making oil change, flush gear chamber thoroughly with oil to clean out bronze particles.

Grease ball bearing 13 (fig.3 or 4) on motor side every six months and proceed as follows:

- 1) Unscrew nut 8d and remove fan 8b.
- 2) Unscrew hexagon head screws 11 and remove bearing cover 14 with felt ring 12 and gasket 15.
- 3) Fill in ball bearing grease. Make sure not to fill bearing completely.

8. ASSEMBLING THE BOWL AND THE FEED AND DISCHARGE SYSTEM

=====

(for tools, see fig. 10)

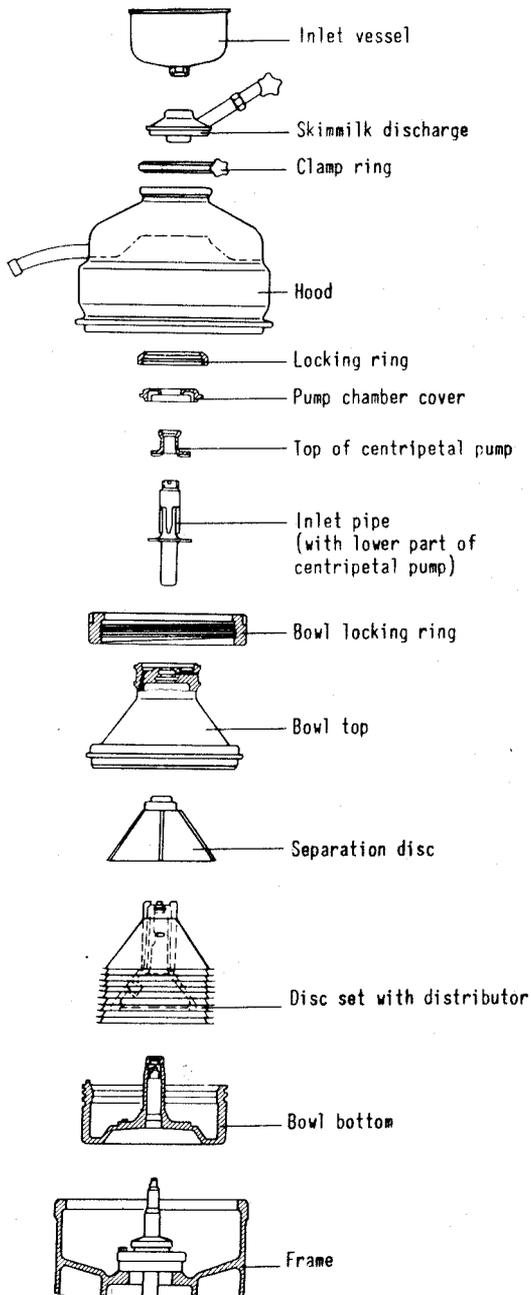

Fig. 2

Parts of bowl and feed and discharge system in the order of assembly.

For correct assembly of bowl and of feed and discharge system see fig.2. All bowl parts are marked with an "O" and all "O" marks must be aligned. Make sure that bore of bowl nave is dry and clean.

Prior to installing bowl bottom, put 2 or 3 drops of oil on guide surfaces of spindle cap 25f and of spindle guiding ring 25k (fig.3 or4), so that both parts can be easily moved on spindle.

Make sure that the "O" mark at the top of worm spindle 25a is in line with the "O" mark on one of the reinforcements holding bowl locking screws 3 (fig.3 or4).

- 1) By means of lifting device 13, place bowl bottom on worm spindle and be sure that "O" mark on locating cam is above the "O" mark on one of the reinforcements holding the bowl locking screws. The bowl locking screws must fit in the corresponding slots of the bowl bottom.
- 2) Turn locking screws slightly into recesses of bowl bottom.
- 3) Use tool 15 to place distributor into bowl bottom; watch for proper alignment.
- 4) Stack discs on neck of distributor in numerical order, disc No.1 on bottom.
- 5) Put on the specially shaped upper disc.
- 6) Insert gasket in bowl top.
- 7) Put on bowl top with the aid of lifting tongs 20.
- 8) Carefully clean and grease threads of bowl bottom and of bowl locking ring as well as centering and bearing surfaces. If bowl is made of solid stainless steel, Molykote paste should be vigorously rubbed or brushed into metal surfaces to prevent jamming.

Screw on bowl locking ring by hand in counter-clockwise direction and tighten it by rapping handle of wrench 22 with a mallet until "O" marks on ring and on bowl top are in line. Do NOT slip a pipe over wrench handle to obtain leverage!

- 9) Insert inlet pipe in distributor neck.
- 10) Put on upper part of centripetal pump.
- 11) Insert gasket in centripetal pump chamber cover.
- 12) Put on centripetal pump chamber cover.
- 13) Screw on centripetal pump chamber cover locking ring in counter-clockwise direction and tighten it by rapping handle of wrench 21 lightly with a mallet.
- 14) Mount the hood and fasten it with hinge screws.
- 15) Mount the skimmilk discharge and fasten it with clamp ring.
- 16) Install inlet vessel and tighten it, however without applying too much effort, - while holding inlet pipe with socket wrench 12, if necessary.

For the arrangement of the feed pipe with WESTFALIA High-Pressure Float for maintaining equal feed, see page 37-.

Check gaskets in bowl top, centripetal pump chamber cover, and in skimmilk discharge for wear. Replace them, if necessary.

After dismantling the bowl, place bowl parts on a rubber or wooden surface. Stack discs on drying rack 1 and put distributor on base 10. Never place bowl top on stone floor or into bowl locking ring.

9. THE SEPARATOR IN OPERATION

=====

After opening the feed cock, adjust cream quantity at skimmilk discharge valve. By turning the adjusting screw in clockwise direction more cream with a lower fat content is obtained.

If, in spite of an open skimmilk valve the cream flow is too important, inspect gaskets of skimmilk discharge or of centripetal pump chamber cover and check whether the overlapping edges at the seats of these gaskets are damaged; it might also be possible that the counterpressure is too high for the installed centripetal pump. In both cases, skimmilk penetrates into the cream catcher and the cream is diluted.

The built-in centripetal pump -3 47/64" for MN 3004D and MN 3004 and 3 15/16" for MN 5004D and MN 5004 (until 4 kg/cm²) is in general sufficient to press the milk without any additional pump through the heater or other apparatus.

In some cases, especially when using heaters with a low counterpressure it may be suitable to install in the line to follow or ahead of the heater a throttling valve which should be set at about 21 - 26 psig.

If overflow occurs in spite of an open skimmilk valve, the built-in centripetal pump is too small in diameter. Reduce feed rate for the time being and check with the factory for larger diameter centripetal pumps.

The separating temperature should be about 40°C , (104°F). If the milk has a tendency to precipitate too great an amount of albumin, a separating temperature of about 35°C (95°F) may be more suitable.

In case of variations of cream flow, the vent holes of the upper part of the bowl top below the centripetal pump chamber are plugged; if necessary, use a wire to keep the vent holes open.

Possible causes for inefficient separation

- 1) Unfavourable pre-treatment of milk (pumps, agitator, high temperature)
- 2) Variations in feed temperature in RPM of bowl or throughflow capacity.
- 3) Leakage at separation disc.

Take skimmilk samples at screwed union of skimmilk discharge assembly.

If the trouble cannot be found with the separator or with the equipment ahead of the separator, check condition of chemicals used to analyse the skimmilk. Make a test in filling water instead of skimmilk into butyrometers.

After separation, feed warm water to the separator, until milk is completely discharged; then rinse with cold water.

L I S T O F P A R T S
=====

IMPORTANT !

When ordering parts, please indicate the following:

- 1) Model }
- 2) Serial No. }

of Separator:

Both designations are shown on the name-plate.

The Serial No. also appears in the upper frame part and on the bowl locking ring.

- 3) Description }
- 4) Part No. }

of the part to be replaced:

For details, refer to List of Parts.

The Part No. is also shown on all major parts.

- 5) Bowl No.

when ordering bowl parts only.

The bowl No. appears, in large figures, on the bowl locking ring and on the bowl bottom.

7	Brush 50x125x285 (for discs)	1	0003-4690-960	0003-4690-960
8	Rotating brush	1	0003-4667-800	0003-4667-800
9	Brush 70x100x500 (for distributor)	1	0003-4695-960	0003-4695-960
10	Base (for distributor)	1	0003-4623-950	0003-4625-950
11	Hexagon socket wrench 19 DIN 659	1	0003-4229-030	0003-4229-030
12	Socket wrench (for inlet pipe)	1	0003-0130-000	0003-0130-000
13	Bowl lifting device	1	1071-9905-010	1072-9905-010
14	Pressure oil can	1	0003-0256-890	0003-0256-890
15	Distributor lifting device	1	0807-9839-010	1033-9970-000
16	Double wrench 10x14 DIN 895	1	0003-4202-110	0003-4202-110
17	Double wrench 17x19 DIN 895	1	0003-4205-110	0003-4205-110
18	Double wrench 27x32 DIN 895	1	0003-4211-110	0003-4211-110
19	Oil cup	1	0003-0274-000	0003-0274-000
20	Lifting tongs (for bowl top)	1	0003-3462-170	0003-3466-170
21	Annular wrench (for centripetal pump chamber locking ring)	1	0003-3988-000	0003-3992-000
22	Annular wrench (for bowl locking ring)	1	0003-4049-030	0003-4056-030
23	Mallet	1	0003-0200-000	0003-0200-000
24	Neck bearing protection hood	1	0003-0296-000	0003-0296-000
25	Wrench for sight glass	1	0003-4585-000	0003-4585-000
-	Can containing 3 litres of lubricating oil 53; viscosity at 50°C: 45 to 61 cSt = 6 to 8E (SAE 30)	2	0015-0002-080	0015-0002-080
26	Clutch puller	1	1033-9911-000	1033-9911-000
